MAIN FEATURES

NOTE: Care should be taken in the interpretation of month-to-month movements in the original and seasonally adjusted data - see paragraphs 38 and 46 to 47 of the Explanatory Notes. Readers are advised that the last three months' trend estimates are provisional, and could change when data for future months are available.

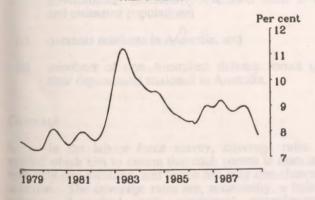

South Australia

The November 1988 estimate (seasonally adjusted) of employed persons was 629,500, an increase of 31,500 (5.3 per cent) from November 1987. Trend estimates indicate a continuation of the strong growth which has been evident since November 1987. Male employment has shown a strong upward movement since March 1988 while female employment growth for the same period has been more subdued (see graphs on page 11).

UNEMPLOYMENT RATE TREND SERIES

The seasonally adjusted unemployment rate fell from 9.1 per cent in November 1987 to 7.6 per cent in November 1988, to be at its lowest level since April 1982. Trend estimates indicate a strong downward movement since May 1988. The trend unemployment rate for males has fallen by 1.5

percentage points since May 1988, while the corresponding rate for females has fallen by 0.6 percentage points.

• The labour force participation rate (seasonally adjusted) increased from 60.3 per cent in November 1987 to 61.6 per cent in November 1988, to be at its highest level since July 1979. Trend estimates indicate a continuation of the growth pattern evident since December 1987. The trend rate for males has grown strongly since March 1988, reversing the downward trend evident since August 1978. By contrast, the trend rate for females peaked in April 1988 and has fallen marginally since.

Regions of South Australia

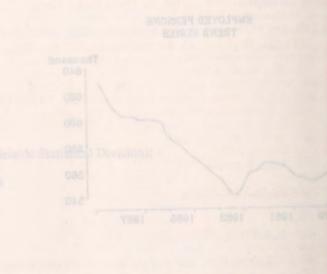

With reference to original data,

- Total employment in the Adelaide Statistical Division increased by 21,600 (5.0 per cent) over the year, including an increase of 20,800 (6.2 per cent) in full-time employment. The unemployment rate fell from 8.7 per cent in November 1987 to 7.0 per cent in November 1988, to be at its lowest November level since 1979, while the number unemployed fell by 7,100 (17.2 per cent)
- In the Balance of South Australia, employment grew by 10,000 (6.0 per cent) over the year, including an increase of 8,900 (7.1 per cent) in full-time employment. However, the number of persons unemployed changed little, due to a substantial increase in labour force participation. The labour force growth of 9,600 (5.3 per cent) over the year is reflected in an increase in the participation rate from 62.5 per cent in November 1987 to 64.8 per cent in November 1988.

Care should be taken in the interpretation of month to-mouth stovements in the original and seasonally adjusted data — see paragraphs 38 and 46 to 47 of the Explanetory Notes. Readers are advised that the last three months been estimates are provisional, and could change when data for future months are available.

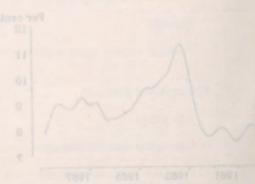

percentage points since May 1988, while the corresponding rate, preferences, has fallen by 0.6 percentage points.

Lubour force rights of the civilian population aged 15 years and ever:

November 1988 estimate (seasonally adjusted applyed persons was 629,800, an increase of (8.3 per cent) from November 1987. Trend ates indicate a continuation of the strong the which has been evident since November Male employment has shown a strong and movement since March 1988 while female

ensonally adjusted unemployment rate fell of per cent in November 1937 to 7.6 per cent tember 1988, to be at its lowest level since 1982. Trend estimates indicate a strong and movement since May 1988. The trend dayment rate for males has fallen by 1.5

(i) Adelaide Samment Division; (ii) Normern Adelaide

industry

The labour force participation rate, (seasonally adjusted) increased from 60.3 per cent in November 1987 to 61.6 per cent in November 1987 to 61.6 per cent in November 1987 to 61.6 per cent in November 1988, to be at its highest level since July 1979, Trand estimates indicate a continuation of the growth pattern evident since December 1987. The trend rate for males has grown strongly since March 1988, males has grown strongly since March 1988, reversing the downward trend evident since August 1978. By contrast, the trend rate for females peaked in April 1988 and has fallen marginally since.

Regious of South Australia

With reference to original data,

Total employment in the Adelaide Statistical Division increased by 21,500 (5.0 per cent) over the year, including an increase of 20,800 (6.2 per cent) in full-time employment. The unemployment rate felt from 8.7 per cent in November 1988, to be at its lowest cent in November 1988, to be at its lowest November level since 1979, while the number unemployed fell by 7,100 (17.2 per cent)

In the Salance of South Australia, employment grew by 10,000 (6.0 per cent) over the year including an increase of 3,900 (7.1 per cent) in full-time employment, However, the number of persons unemployed changed little, due to a substantial increase in labour force participation. The labour force growth of 9,600 (5.3 per cent) over the year is reflected in an increase in the participation rate from 62.5 per cent in November 1937 to 64.8 per cent in November 1938.

EXPLANATORY NOTES

Introduction

This publication contains estimates of the civilian labour force derived from the labour force survey part of the monthly population survey, including estimates for regions of South Australia.

- 2. Preliminary survey results are published in advance of this more detailed publication in *The Labour Force*, Australia, Preliminary (6202.0).
- 3. Although emphasis in the population survey is placed on the regular collection of data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are published and are available on request. A list of publications on labour force and related topics is given in *The Labour Force*, Australia (6203.0).

The Population Survey

4. The population survey is based on a multi-stage area sample of private dwellings (about 5,000 houses, flats, etc.) and a list sample of non-private dwellings (hotels, motels, etc.), and covers about nine-tenths of one per cent of the population of South Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained related to the week before the interview week (i.e. the reference week).

Scope

- 5. The labour force survey includes all persons aged 15 and over except:
- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- (c) overseas residents in Australia; and
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia.

Coverage

- 6. In the labour force survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The coverage rules are, necessarily, a balance between theoretical and operational considerations. Nevertheless, the chance of a person being enumerated at two separate dwellings in the one survey is considered to be negligible.
- 7. Persons who are away overseas from their usual residence for less than six weeks at the time of interview are generally enumerated at their usual residence when relevant information can be obtained from other usual residents present at the time of the survey. Persons who, at the time of interview, are overseas for six weeks or more but for less than twelve months are included in the estimates on the assumption that their labour force

characteristics are similar to those of the persons responding in the survey.

Definitions

- 8. The labour force category to which a person is assigned depends on his actual activity (i.e. whether working, looking for work, etc.) during the reference week. The following definitions, which conform closely to the international standard definitions specified by the International Labour Organisation (ILO), relate only to those persons within the scope of the survey.
- 9. Employed persons comprise all those aged 15 and over who, during the reference week:
 - (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (comprising employees, employers and self-employed persons); or
 - (b) worked for one hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or
- (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the reference week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the reference week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full—time study; or
- (d) were employers, self-employed persons or unpaid family helpers who had a job, business or farm, but were not at work.
- 10. Full-time workers are those who usually work 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the reference week. Part-time workers are those who usually work less than 35 hours a week and who did so during the reference week.
- 11. Hours of work. The estimates of aggregate hours and of average hours refer to actual hours worked during the reference week, not hours paid for. The estimates may be affected by public holidays, leave, absenteeism; temporary absence from work due to sickness, injury, accident and industrial disputes; and stoppages of work due to bad weather, plant breakdown, etc. When hours of work are recorded, fractions of an hour are disregarded and this results in slightly lower estimates than would be the case if actual time worked was recorded. Persons stood down for the whole of the reference week without pay because of bad weather or plant breakdown at their place of employment are regarded as employed and therefore are included (working no hours) in the calculation of average hours worked. Persons stood down in the reference week for reasons other than bad weather and plant breakdown and waiting to be called back to their job are regarded as unemployed and are excluded from the calculations.
- 12. Unemployed persons are those aged 15 and over who were not employed during the reference week, and
 - (a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:

- (i) were available for work in the reference week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the reference week); or
- (ii) were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then;
- or (b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant breakdown.
- 13. Actively looking for work includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency, advertising or tendering for work; and contacting friends or relatives.
- 14. The *labour force* comprises all persons who, during the reference week, were employed or unemployed, as defined above.
- 15. The *unemployment rate* for any group is the number unemployed expressed as a percentage of the labour force (*i.e.* employed plus unemployed) in the same group.
- 16. Duration of unemployment is the period from the time the person began looking for work or was laid off to the end of the reference week. Thus the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full-time for two weeks or more to the end of the reference week. Periods of unemployment are recorded in complete weeks and this results in a slight understatement of duration. Average (mean) duration is the duration obtained by dividing the aggregate number of weeks a group has been unemployed by the number of persons in that group. Median duration is the duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median, and the other, persons whose duration is below it.
- 17. Persons not in the labour force are those who, during the reference week, were not in the categories employed or unemployed, as defined above.
- 18. The labour force participation rate for any group is the civilian labour force expressed as a percentage of the civilian population aged 15 and over in the same group. Because it is not practicable to ascertain the birthplace of persons in institutions (who are classified as not in the labour force), labour force participation rates for persons classified by birthplace are calculated by using population estimates which exclude those in institutions.
- 19. Persons classified by labour force status are classified according to whether or not they are in the labour force. Persons in the labour force classified by employment status are classified according to whether they are employed or unemployed. This publication includes a table showing estimates of employed persons, obtained from the labour force survey, classified by status of worker i.e. whether they were employers, self-employed persons,

- wage and salary earners (employees), or unpaid family helpers.
- 20. Industry is classified according to the Australian Standard Industrial Classification (ASIC) 1983 (1201.0 and 1202.0) and occupation according to the Australian Standard Classification of Occupations (ASCO) 1986 (1222.0).
- 21. Occupational data classified to ASCO was introduced for the August 1986 survey, replacing the Classification and Classified List of Occupations (CCLO), Revised November 1980 (1206.0), used in previous surveys. The new classification relies on the level and specialisation of skill required to satisfactorily perform primary tasks as its classificatory variable and is therefore significantly different from the previous classification. The appendix in the August 1986 issue of this publication contains a more detailed explanation of the concepts and structure underlying the classification.
- 22. A matrix of the two classifications at the broadest classification level (Major Group) was included in the appendix to the November 1986 issue of this publication. The estimates contained in the matrix were derived from the May 1986 Labour Force Survey. The responses to questions on the occupations of employed persons were coded to both ASCO and CCLO classifications, and the matrix was produced by cross-classifying ASCO Major Groups by CCLO Major Groups. A similar matrix for Australia was published in the August 1986 issue of *The Labour Force*, *Australia* (6203.0). More detailed cross-classifications (by sex for States, and by age and Minor Groups for Australia) are available on request.
- 23. In the labour force survey, persons are classified as married or not married. Marital status is determined from information supplied by the respondent about the individual, and, where the person was reported as being married, about the living arrangements of persons usually resident in the household. Marital status does not therefore necessarily reflect legal status. Persons are classified as married if they are reported as being married (including de facto) and their spouse was a usual resident of the household at the time of the survey. The not married category includes persons who have never married, or are separated, widowed or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household. Persons who live in a de facto relationship but do not volunteer this information when asked whether they are married are classified as not married. For details of discontinuities in estimates of marital status, see paragraphs 35 and 36.

Regions of South Australia

24. A number of minor changes to regional boundaries and names were introduced with the implementation of a new sample between September and December 1987 (see paragraph 38 below). These changes have not materially affected the continuity of regional data. The regions used in this publication are standard ABS Statistical Regions (see maps) and do not necessarily correspond with regions adopted by other government authorities.

Population Benchmarks

25. Labour force survey estimates of persons employed, unemployed and not in the labour force are calculated in such a way as to add up to the independently estimated distribution of the population aged 15 and over by age and sex. This procedure compensates for underenumeration in the survey, and leads to more reliable estimates. The independent population statistics (benchmarks) are the latest available estimates at the time

the labour force survey is conducted, but they usually differ from the official population estimates subsequently published in *Australian Demographic Statistics* (3101.0) because they are necessarily derived from incomplete information about population changes.

- 26. New benchmarks based on the results of the 1986 Census of Population and Housing will be available in 1988 and are expected to be introduced by February 1989. They will result in labour force estimates being revised for the period January 1984 to January 1989. All estimates produced after January 1989 are expected to be based on the new benchmarks.
- 27. Regular estimates of the population at the regional level are not available, and so benchmarks for the Adelaide Statistical Division and the Balance of South Australia have been used to produce regional estimates. For this reason, estimates of the civilian population aged 15 years and over are not made available at the regional level.

Revision of Series

- 28. Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each census of population and housing, and when population estimation bases are reviewed. The last such revision was made in February 1984 to take account of the results of the 1981 Census, which affected all monthly estimates from February 1978 to January 1984.
- 29. Following the change in official population estimates to a place of usual residence basis after the 1981 Census, the population benchmarks used in the estimation of labour force survey data are compiled according to place of usual residence. For an explanation of the new conceptual basis of population estimates see *Population Estimates: An Outline of the New Conceptual Basis of ABS Population Estimates* (3216.0). To co-ordinate with the new benchmarks, the labour force survey questionnaire was changed in October 1982 to enable identification of each respondent's place of usual residence. Revised estimates for October 1982 onwards are based entirely on place of usual residence. For periods before October 1982, the estimates are based on a combination of place of enumeration and place of usual residence.
- 30. Until February 1978, surveys were conducted in February, May, August and November each year from 1964. From February 1978 the survey has been conducted on a monthly basis.
- 31. The questionnaire used in the survey for the collection of labour force data has been revised a number of times, the latest occasion being for the April 1986 survey. Details of these changes have been published in Information Paper: Questionnaires Used in the Labour Force Survey (6232.0) issued in March 1978, December 1981, August 1984 and June 1986.
- 32. The latest revision to the questionnaire, in April 1986, follows the extension of the definition of employed persons to include persons who worked without pay for between 1 and 14 hours during the reference week in a family business or on a farm (i.e. unpaid family helpers). This new definition aligns the Australian labour force concepts with a set of changed international definitions adopted by the International Labour Office at the 13th Conference of Labour Statisticians in October 1982.
- 33. Previously, such persons who worked 1 to 14 hours or who had such a job but were not at work were defined as either unemployed or not in the labour force, depending on

whether they were actively looking for work.

Comparability of Series

- 34. As noted in paragraphs 28 and 29, estimates back to February 1978 have been revised to conform to revised population estimates. The revised estimates are not strictly comparable with estimates for periods before February 1978. An assessment of the effect of the revisions on labour force estimates is contained in the appendix to *The Labour Force*, *Australia*, *February 1984* (6203.0).
- 35. Paragraph 23 outlines the definition of marital status now used in the labour force survey. In conjunction with the revision of estimates back to February 1978 to conform to revised population estimates, a revision to take account of the new definition of marital status was also applied. Consequently, estimates of marital status contained in this issue are not comparable with estimates published before the February 1984 issue, which classified as married all respondents who reported that they were married or separated. The revision to the marital status classification was undertaken in two parts. Firstly, for all surveys from February 1978, persons who reported that they were separated, were reclassified as not married. Secondly, from June 1983 onwards, the not married category was expanded to also include persons who, although reported as married, did not have a spouse who was a usual resident of the household at the time of the survey.
- 36. Before October 1982, respondents who stated they were living in a *de facto* arrangement were asked how they would describe their marital status on a population census schedule and the answer was recorded. From October 1982 these respondents were coded as married. This may have resulted in some discontinuity between September and October 1982 in series classified according to marital status.
- 37. Comparability with estimates produced from the quarterly survey of employment and earnings is affected by the use of a different survey methodology and definitions. The labour force survey provides estimates of people in jobs whereas the survey of employment and earnings provides an estimate of the number of jobs held by wage and salary earners. A more detailed description of the differences between these two series is provided in Information Paper: Comparison of Employment Estimates from the Labour Force Survey and the Survey of Employment and Earnings (6263.0).

Survey Sample Redesign

38. The labour force survey sample has been redesigned and reselected using information collected in the 1986 Population Census. The new sample was phased in over the period September to December 1987. For details, see Information Paper: Labour Force Survey – Sample Design (6269.0).

Reliability of the Estimates

- 39. Estimates in this publication are subject to two sources of error.
 - (a) sampling error: since the estimates are based on information obtained from occupants of a sample of dwellings, they, and the movements derived from them, may differ from the figures that would have been produced if all dwellings had been included in the survey. As noted in paragraph 27 above, the use of benchmarks in the compilation of regional estimates has not been possible. For this reason users should note that regional estimates may be

more volatile than corresponding State estimates and therefore they should not be regarded as reliable indicators of short-term (monthly) movements. More information on sampling error is given in the Technical Notes at the end of this publication.

(b) non-sampling error: inaccuracies may occur because of imperfections in reporting by respondents and interviewers and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Differences Between Population Census and Population Survey Estimates

- 40. The results of the 1986 Census of Population and Housing show that labour force figures derived from the census differ from estimates derived from the labour force surveys.
- 41. The broad concepts underlying the measures of the labour force and its components, employment and unemployment, are similar in the census and the survey. However there are considerable differences in both the collection methodology adopted (including the detailed questions asked) and estimation procedures. Factors contributing to differences in estimates include: underenumeration in the population census for which census labour force estimates have not been adjusted; the use in the labour force survey of population benchmarks derived from incomplete information about population change (see paragraphs 25 and 26); the inclusion of permanent defence forces in census estimates; the personal interview approach adopted in the survey as opposed to self—enumeration of census schedules; differing questions used to determine labour force characteristics (particularly the identification of unemployed persons); and differing methods of adjustment for non–response to the survey or census.
- 42. The labour force survey provides detailed and up-to-date estimates of employment and unemployment for Australia, States and Statistical Regions, whereas the census of population and housing provides counts for small areas but in less detail than is available from the survey.
- 43. These considerations should be borne in mind if comparisons are made between population census and labour force survey estimates.

Seasonal Adjustment

- 44. Seasonally adjusted series are published in Table 2. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not remove the irregular or non-seasonal influences which may be present in any particular month. Influences that are volatile can still make it difficult to interpret the movement of the series even after adjustment for seasonal variation.
- 45. As happens with all seasonally adjusted series, the seasonal factors are reviewed annually to take account of each additional year's original data. The latest review, in February 1988, revised seasonally adjusted and trend monthly series back to February 1978. Information about the method of adjustment, and revised seasonally adjusted and trend estimates for all months back to January 1979,

were published in the appendix to the February 1988 issue of this publication.

- 46. It is possible that the seasonality of employment, unemployment and labour force participation has been affected by changes introduced during 1987 to the pattern of school holidays.
- 47. The impact of these changes on seasonally adjusted estimates of labour force characteristics cannot be assessed at this stage.

Trend Estimation

- 48. Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson-weighted moving average to the respective seasonally adjusted series. These trend series are used to analyse the underlying behaviour of the series over time. Table 2 shows trend estimates for the past 15 months, while the appendix to the February 1988 issue shows estimates back to January 1979. Trend series graphs are shown on page 11.
- 49. While this smoothing technique enables estimates to be produced which include the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller and, after 3 months, have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors mentioned in paragraph 45.
- 50. Users may wish to refer to the ABS Information Papers: A Guide to Smoothing Time Series Estimate of 'Trend' (1316.0), and Time Series Decomposition An Overview (1317.0), for more detailed information on producing trend estimates by smoothing seasonally adjusted time series data.

Month-to-month Movements

51. Care should be taken in the interpretation of month-to-month movements in these estimates. Survey estimates are subject to sampling and non-sampling variability as explained in paragraph 39. Particular care should be taken in the interpretation of the recent original and seasonally adjusted monthly movements as these may have been affected by the changed pattern of school holidays. Trend estimates are expected to be relatively unaffected by these changes.

Unpublished Statistics

52. In some cases, the ABS can also make available information which is not published. This information may be made available in one or more of the following forms: floppy disk, microfiche, photocopy, data tape, computer printout or manually-extracted tabulation. In general, a charge is made for providing unpublished information. Inquiries should be made to the State Labour Force Liaison Officer on (08) 237 7438 or to Information Services in the nearest ABS office.

TECHNICAL NOTES

The labour force survey sample has been redesigned and reselected using information collected in the 1986 Population Census. The new sample was phased in over the period September to December 1987. For details see Information Paper: Labour Force Survey-Sample Design (6269.0). For more information on sample design, estimation procedures, and reliability of the estimates for surveys prior to September 1987, reference should be made to the Technical Note in The Labour Force, Australia, Historical Summary, 1966 to 1984 (6204.0).

Estimation Procedure

2. The labour force estimates are derived from the monthly population survey by use of a complex ratio estimation procedure. This procedure ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

Reliability of the Estimates

- 3. Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. For an explanation of non-sampling error see paragraph 13. The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, the estimates, and the movements derived from them, are subject to sampling variability; that is, they may differ from the figures that would have been obtained if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of sampling variability is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoids the need to refer also to the size of the estimate.
- 4. Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates derived from the survey and of monthly, quarterly and annual movements for South Australia and for each region of South Australia, can be determined by using the table on page 40.
- 5. The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.
- 6. As the standard errors in the following table show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates with relative standard errors of 25 per cent or less, and percentages based on such estimates, are considered sufficiently reliable for most purposes. However, estimates and percentages with higher relative standard errors have been included, and are preceded by an asterisk (e.g. *1.8). This indicates that they are subject to high relative standard errors and should be used with caution. See paragraph 10 concerning the derivation of relative standard errors for certain types of estimates.
- 7. The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is also given in the following table. The estimates of standard errors of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated. Standard errors of quarterly movements can be obtained by multiplying the figures shown in column 1 of the following table by 1.22. Standard errors of all annual movements can be obtained by multiplying the figures in column 1 of the following table by 1.3. When using the following table to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.
- 8. Examples of the calculation and use of standard errors are given below:
 - (a) From column 1 of the following table it can be seen that the estimate of 375,500 employed males in South Australia in November 1988 (see Table 1) has a standard error of approximately 3,600 (by interpolation). There are about two chances in three that the true figure that would have been obtained if all dwellings had been included in the survey would have been within the range 370,900 to 378,100 and about nineteen chances in twenty that it would have been within the range 367,300 to 381,700.

- (b) The estimate of movement in the number of employed males in South Australia from October 1988 to Standard error of the monthly movement for the larger of the two estimates from which the movement is Australia, it can be seen that the standard error of the monthly movement is Australia, it can be seen that the standard error of the monthly movement is approximately 3,100 (by movement would have been in the range +2,100 to +8,300 and about nineteen chances in twenty that it would
- 9. It must be remembered that there is no justification for saying that the 'true' estimate is more likely to be at any one point in the range than at any other.
- 10. The relative standard errors of estimates of average hours worked, average (mean) duration of unemployment, and median duration of unemployment, are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see column 2 in the following table) and then multiplying the figure so obtained by the following relevant factors:

average hours worked: 0.7

average (mean) duration of unemployment: 1.3

median duration of unemployment: 2.0

11. Proportions and percentages (for example, participation rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below:

$$RSE(x/y) = \sqrt{[RSE(x)]^2 - [RSE(y)]^2}.$$

- 12. Standard errors contained in the following table are designed to provide an average standard error applicable for all monthly labour force survey estimates. Analysis of the standard errors for South Australia applicable to particular survey estimates has shown that the standard errors on estimates of employment are generally equivalent to those shown in the following table, while standard errors for estimates of unemployment and not in the labour force are approximately 3 per cent and 11 per cent higher, respectively, than those shown in the table. For aggregate estimates of persons born outside Australia the standard errors are about 15 per cent higher. The standard errors vary for individual countries of birth, but are generally less than 10 per cent higher.
- 13. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection, such as in recording and coding of data, and errors made in processing the data. Inaccuracies of this kind are referred to as non-sampling errors. They may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce non-sampling errors to a minimum by careful design of questionnaires, intensive training and supervision of interviewers, and efficient operating procedures.
